

DOMESTIC METER BOX OPTIONS

A) Surface Mounted Meter Box

The box should be placed on an exterior wall that is appropriate and easy to reach, with the bottom of the box positioned at a height between 500mm and 1500mm above the final ground level, and also above the damp proof course. With these boxes projecting around 250mm from the wall, assess if they could create an obstruction or be damaged, for example, by passing vehicles.

B) Unibox/Multi Box

This box can be installed either flush with the ground, buried 75mm deep, or mounted on a wall, ensuring the ground aligns with the marker on the box. The placement should avoid obstructing pedestrians and prevent any potential vehicle-related damage. This installation may not be suitable for all types of property. This meter box protrudes out approximately 300mm.

C) Built-in/Recessed in wall Box

GTC isn't responsible for this box's supply or installation. Work of this nature must be carried out by yourself (or your builder) prior to GTC arriving on site. The base of these boxes should be located between 500mm and 1500mm
